

Bullstreet Academy - Implementation Summary

Date: 2026-10-04

Repo: <https://github.com/OPOKA-ERIC/Bullstreet-Trading-Academy>

WHAT WAS DONE:

- Created /app/: login.html, signup.html, assessment.html, dashboard.html, task.html, lesson.html, grading.html
- Created /js/: supabase-client.js, auth.js, app-utils.js, assessment.js, dashboard.js, task.js, grading.js
- Built timed Impulse Test (time pressure + response time + click speed + diagnosis)
- Built task submission system (text+files), rubric manual grading, retry with alternate variants, verification chaining
- Configured Supabase: schema, RLS, submissions storage bucket, seeded test questions
- index.html: updated CTA to app/assessment.html (only 2 edits), all else preserved
- student.html: converted to redirect to app/dashboard.html
- Added social links (Telegram, YouTube, Instagram, Email) in dashboard footer

PRESERVED (UNCHANGED):

- styles.css, script.js - untouched
- All images, PDFs, DOCX, docs/ folder - untouched
- Original content/structure fully preserved

NEXT STEPS TO CONTINUE FROM:

- Add tasks per diagnosis (auto-seed prescription by diagnosis_code)
- Optionally add Relapse Log + badges (gamification)
- Create task_variants for alternate retry formats
- Assign tutor role to your email in Supabase if not done
